

Angelica pachycarpa

Common Name(s):

angelica

Current Threat Status (2009):

Exotic

Habitat:

Terrestrial. Mainly coastal, waste places.

Features:

Stout fleshy short-lived perennial up to 1m tall with faint aniseed odour. The stems are hollow and grooved. Leaves are dark green and glossy, and are variable in shape. Basal leaves are 2-3 pinnate and with an obvious petiole. Stem leaves are 1-3 pinnate and with much shorter petiole. Numerous greenish white flowers are held in flat-topped umbels 10-20 cm diameter. The fruit are up to 12 mm long, brown with lighter coloured wings.

Flowering:

November, December, January
