

## *Calliergidium austro-stramineum*

### **Common Name(s):**

Moss

### **Current Threat Status (2009):**

Data Deficient

### **Distribution:**

Indigenous. New Zealand: South Island (Cape Foulwind, near Westport). Mainly found in Antarctica and subantarctic islands.

### **Habitat:**

In coastal wetlands

### **Threats:**

First recognised from New Zealand in 1984 when it was found near Cape Foulwind. Despite searching it has not been there again and it is possibly that local changes in farming and farm management in that area may have wiped it out (Glenny et al. 2011).
