

Uredo salicorniae

Common Name(s):

None

Distribution:

Auckland, Mid Canterbury

Features:

Uredinia amphigenous and on stems and bracts, scattered, bullate, 0.2–0.6 mm. diameter, ferruginous, pulverulent, partially covered by the ruptured epidermis. Spores elliptical, obovate or subglobose, 26–32 x 24–28 μm , epispore chestnut brown, 2 μm thick, finely and closely echinulate; germ pores scattered, 10–12; immixed with numerous hyaline, cylindrical paraphyses. The large number of scattered germ pores and presence of paraphyses separate this rust from the uredinial stage of *Uromyces salicorniae*; the latter having only four germ pores.

Fruiting:

Known from two specimens collected in January 1929 and 1956.
